Castries, November 30, 2017 – St. Lucia Electricity Services Limited (LUCELEC) would like to inform the general public that from Monday, December 4, 2017 the company will commence excavation works on the West Coast road from Soufriere near the Quatre Chemin junction.

Image not found or type unknown

This is to allow LUCELEC to install ducts and run 66kV cables (high voltage lines) underground from the Bouton junction stretching approximately 400 meters north towards Belvedere. The lines are being placed underground to relocate them from an area under threat from land slippage. Relocating the lines underground along with other planned improvements will make the electricity supply for customers from Canaries to Vieux Fort even more reliable.

The excavation works will be undertaken over a three week period. Heavy equipment, machinery and personnel will be on site from 9:00am to 4:00pm daily. Motorists using this route are asked to proceed with caution in the vicinity of the works.

LUCELEC deeply regrets any inconvenience which the road works may cause and wishes to thank the general public for their patience and understanding.
